

TECH INNOVATORS INC.

HR Analytics Business Intelligence Report

1. Executive overview findings

The analysis shows that employee attendance is strong at 90.6%, indicating that workforce availability is not the primary challenge. The more significant issues relate to employee development and performance consistency. Training completion is 48.8%, creating a training gap of 51.2%. Average performance is 3.2 and average engagement is 3.0, both indicating moderate workforce health rather than high performance. The dashboard identifies 84 employees in the development-risk group, based on incomplete training combined with low performance or low engagement.

Benefits participation is high at 100%, but satisfaction differs considerably by benefit type. Health Insurance delivers strong value through high usage and high satisfaction, while the Wellness Program requires review due to low satisfaction. Gym Membership is heavily used but moderately rated, suggesting an opportunity to improve value or supplier quality.

Key performance indicators

244	90.6%	48.8%
Total Employees	Attendance Rate	Training Completion
Workforce size analysed	Strong workforce availability	Below desired level
3.2	3.0	3.1
Average Performance	Average Engagement	Benefit Satisfaction
Moderate performance level	Requires strengthening	Moderate perceived value
45.1%	36.1%	84
High Performer Rate	Low Performer Rate	Development Risk Employees
Positive performance segment	Requires performance support	Priority intervention group

2. Workforce demographics findings

The workforce is geographically balanced, with New York representing the largest location and remote employees forming a similarly large segment. This highlights the importance of designing HR policies that work for both office-based and remote employees.

Segment	Finding	Business interpretation
Location	New York has 68 employees; Remote has 64; Austin has 58; San Francisco has 54.	Workforce distribution is balanced. Remote employees represent a large population and should be included in training, engagement and benefit planning.
Age	Average age is 38. The largest groups are 30-39 and 40-49.	The workforce is concentrated in established career stages. The 30-39 group is particularly important because it is the largest group.
Tenure	Average tenure is 4.05 years. The 3-5 years group contains 126 employees.	The organisation has a sizeable core of employees with moderate tenure. Retention and progression planning should focus on this group.
Gender	Male 52%, Female 38.1%, Other 9.8%.	Gender distribution should be monitored across departments, roles and performance groups to support inclusive workforce planning.
Performance by age	The 30-39 group has the lowest average performance; the 50+ group has the highest but is very small.	Performance support in the 30-39 group could have a large organisational impact due to its size.

3. Performance and training findings

Performance and training analysis provides the clearest evidence for HR intervention. Training completion is below 50%, and trained employees show slightly higher performance and engagement than untrained employees. This suggests that improving training completion is a practical lever for strengthening capability and workforce engagement.

Analysis area	Finding	Implication
Performance by department	Marketing has the strongest average performance at 3.6. HR and Finance are lowest at 2.8.	HR and Finance should be reviewed for workload, role expectations, development needs and manager support.
Engagement by department	HR and IT have the highest engagement at 3.2. Legal is lowest at 2.4, followed by Sales at 2.7.	Legal and Sales require engagement diagnostics such as manager check-ins, pulse surveys or workload review.
Development risk by department	Sales has 18 development-risk employees, IT has 17 and Finance has 15.	These departments should be prioritised for coaching and training follow-up. A rate-based risk view is recommended as a next enhancement.
Training completion	Completion varies by department, with several departments showing material gaps.	Training accountability should be monitored by department rather than treated as a general HR metric only.
Trained vs untrained performance	Trained employees average 3.2 performance compared with 3.1 for untrained employees.	Training completion is directionally associated with stronger performance.
Trained vs untrained engagement	Trained employees average 3.1 engagement compared with 2.9 for untrained employees.	Development participation may improve employee connection and motivation.

4. Benefits utilisation and satisfaction findings

Benefits participation is high at 100%, indicating that every employee has at least one benefit record. However, satisfaction is not equally strong across benefit types. This means that benefit strategy should focus on optimisation rather than broad expansion.

Benefit area	Finding	Interpretation
Overall participation	Employees using benefits: 244; Benefit participation rate: 100%.	Benefits are widely adopted or recorded across the workforce.
Usage by benefit type	Gym Membership has the highest usage at 481; Health Insurance follows at 417; Wellness Program has 258; Paid Time-Off has 9.	Gym Membership and Health Insurance are heavily used. Paid Time-Off usage may be under-recorded or captured differently.
Satisfaction by benefit type	Paid Time-Off has 5.0, Health Insurance 4.1, Gym Membership 3.1 and Wellness Program 1.7.	Health Insurance is strong. Wellness Program requires review due to very low satisfaction.
Usage vs satisfaction	Health Insurance combines strong usage and high satisfaction. Gym Membership has high usage but moderate satisfaction.	Benefits should be categorised into keep, improve, promote and review groups.
Benefit satisfaction by department	Finance and HR show slightly higher satisfaction; Sales and Legal are lower.	Department-level feedback may reveal different benefit needs or communication gaps.

5. Business Recommendations

Recommendation 1: Close the training completion gap

Training completion is below 50%, making it the most immediate workforce development issue. HR should move from generic training reminders to department-level tracking and manager accountability. Training completion should be reviewed monthly and combined with performance and engagement outcomes to assess whether completion is translating into better workforce results.

- Create a department training completion scorecard.
- Set monthly completion targets by department.
- Identify barriers such as workload, scheduling, relevance or communication gaps.
- Escalate overdue training completion to line managers.
- Compare performance and engagement changes after training completion improves.

Recommendation 2: Prioritise development-risk employees

There are 84 development-risk employees. These employees should not be treated as a generic underperformance group. The risk definition identifies employees who have not completed training and also show low performance or engagement, making them suitable for targeted support rather than disciplinary action alone.

- Create a confidential development-risk review list for HR business partners and department managers.
- Separate employees needing training support from those needing performance coaching or engagement support.
- Design short intervention cycles of 30, 60 and 90 days.
- Track whether employees move out of the development-risk group after support is provided.

Recommendation 3: Improve engagement in Legal and Sales

Legal and Sales show the lowest engagement levels. HR should investigate whether low engagement is linked to workload, leadership communication, development opportunities, recognition, role clarity or benefit relevance.

- Run short pulse surveys focused on workload, recognition, manager support and career development.
- Conduct manager-led listening sessions in low-engagement departments.
- Monitor engagement alongside retention and absence over time.
- Develop department-specific action plans rather than applying a single organisation-wide solution.

Recommendation 4: Strengthen performance support in HR and Finance

HR and Finance have the lowest average performance ratings. This does not automatically indicate poor capability; it may reflect workload, unclear expectations, insufficient tools or skills gaps. A structured review should be carried out before implementing performance intervention.

- Review role expectations and performance criteria in HR and Finance.
- Identify whether low performance is concentrated in specific roles or tenure groups.
- Introduce mentoring and manager coaching where appropriate.
- Use performance improvement plans for employees with persistent low ratings, supported by clear development goals.

Recommendation 5: Optimise benefit value

Benefits participation is strong, but satisfaction differs significantly by benefit type. HR should protect high-value benefits, improve high-usage/moderate-satisfaction benefits and review benefits with low satisfaction.

Benefit category	Evidence	Action
Maintain and protect	Health Insurance has high usage and high satisfaction.	Keep as a core benefit and monitor satisfaction over time.
Improve value	Gym Membership has high usage but only moderate satisfaction.	Review provider quality, access, coverage or employee expectations.
Investigate data capture	Paid Time-Off has very high satisfaction but very low recorded usage.	Check whether usage is recorded consistently or captured in another system.
Review or redesign	Wellness Program has low satisfaction.	Gather employee feedback and redesign the offer before further investment.

6. Implementation Roadmap

Timeframe	Action	Owner	Success measure
0-30 days	Validate data quality, confirm training completion definitions and share dashboard with HR leadership.	HR Analytics / HR Operations	Validated dashboard metrics and agreed KPI definitions.
0-30 days	Create development-risk employee review list for HR business partners.	HR Business Partners	Priority employee groups identified and assigned to managers.
31-60 days	Launch department-level training completion follow-up.	Department Managers / L&D	Training completion increases from 48.8% toward agreed target.
31-60 days	Run engagement pulse checks in Legal and Sales.	HR Business Partners	Actionable feedback captured and department plans created.
61-90 days	Review benefit value, focusing on Wellness Program and Gym Membership.	Benefits Team / Finance	Benefit improvement plan produced with cost/value assessment.
90+ days	Track KPI movement and refresh dashboard monthly.	HR Analytics	Trend reporting shows impact of interventions over time.

7. Data Quality, Assumptions and Interpretation Notes

Area	Risk or assumption	Mitigation
Source data structure and field completeness	Some fields may represent simplified HR records rather than fully integrated HRIS data.	Treat findings as directional and validate against operational HR systems before final policy decisions.
Benefit usage recording	Paid Time-Off shows very low usage, which may indicate under-recording or separate tracking.	Confirm how each benefit type is captured before reducing or expanding provision.
Development-risk definition	Risk classification depends on threshold choices for performance and engagement.	Review thresholds with HR leaders and adjust based on organisational standards.
Department size effects	Departments with larger employee counts may naturally show more development-risk employees.	Use Development Risk Rate by Department alongside the existing count view to compare departments proportionally.
Cross-sectional view	The dashboard currently shows a snapshot rather than a time-series view.	Introduce monthly snapshots to measure change and intervention impact.

Conclusion

The HR analytics dashboard provides Tech Innovators Inc. with a consolidated, evidence-based view of workforce performance, training, demographics and benefits. The analysis shows that the organisation has strong attendance and broad benefit participation, but it also identifies important development and performance challenges. The most urgent issue is low training completion, which is linked to broader concerns around development risk, low performance and moderate engagement.

The report recommends a shift from reactive HR review to targeted, data-driven intervention. HR should prioritise training completion, development-risk employees, engagement in Legal and Sales, performance support in HR and Finance, and benefits optimisation. With regular refresh and intervention tracking, this dashboard can become a practical management tool for improving employee experience, workforce capability and organisational performance.
